

DAA lab 4

1). Write a program for assignment problem by brute-force technique and analyze its time efficiency. Obtain the experimental result of order of growth and plot the result.

Code –

```
#include<stdio.h>
```

```
#include<stdlib.h>
```

```
#include<limits.h>
```

```
int ans[1000], min = INT_MAX, opcount;
```

```
void swap(int *a, int *b)
```

```
{
```

```
    int temp = *a;
```

```
    *a = *b;
```

```
    *b = temp;
```

```
}
```

```
void permuter(int l, int r, int arr[][r + 1], int per[])
```

```
{
```

```
    int i;
```

```
    if (l == r)
```

```
    {
```

```
        int sum = 0;
```

```
        for (i = 0; i <= r; i++)
```

```
        {
```

```
            opcount++;
```

```
            int idx = per[i];
```

```
            sum += arr[i][idx];
```

```
        }
```

```
        if (sum < min)
```

```

    {
        for (i = 0; i <= r; i++)
        {
            int idx = per[i];
            ans[i] = arr[i][per[i]];
        }
        min = sum;
    }
}
else
{
    for (i = l; i <= r; i++)
    {
        swap((per + l), (per + i));
        permuter(l+1, r, arr, per);
        swap((per + l), (per + i));
    }
}
}

```

```

int main()
{
    int i, j, n;
    printf("Enter the size of the square matrix : ");
    scanf("%d", &n);
    int arr[n][n];
    printf("Enter the matrix : \n");
    for (i = 0; i < n; i++)
    {
        for (j = 0; j < n; j++)
            scanf("%d", &arr[i][j]);
    }
}

```

```

    }

    int per[n];
    for (i = 0; i < n; i++)
        per[i] = i;
    permuter(0, n - 1, arr, per);
    printf("Combination for minimum cost : ");
    for (i = 0; i < n; i++)
        printf("%d ", ans[i]);
    printf("\nThe Minimum Cost is : %d\n", min);
    printf("Opcount = %d\n", opcount);
    return 0;

}

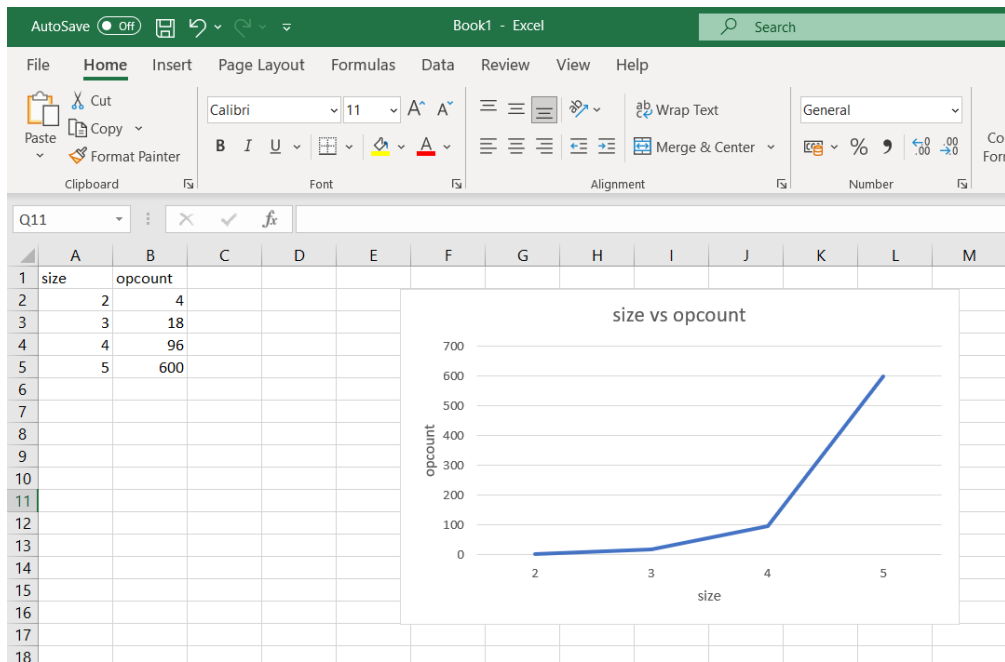

```

Execution –

```

Enter the size of the square matrix : 4
Enter the matrix :
10 3 8 9
7 5 4 8
6 9 2 9
8 7 10 5
Combination for minimum cost : 3 7 2 5
The Minimum Cost is : 17
Opcount = 96

```

Analysis –

The order of growth of this algorithm is seen to be $O(n \cdot n!)$. It is seen by the values in the graph when plotted. Basic operation taken is finding the sum of costs for all $n!$ cases.

2). Write a program for depth-first search of a graph. Identify the push and pop order of vertices.

Code –

```
#include<stdio.h>
```

```
int G[10][10], visited[10], n, pushed[10], popped[10], k1=0, k2=0;
```

```
void DFS(int i)
```

```
{
```

```
    int j;
```

```
    pushed[k1++] = i;
```

```
    printf("\nVisited %d",i);
```

```
    visited[i]=1;
```

```
    for(j=0;j<n;j++)
```

```
        if(!visited[j]&&G[i][j]==1){
```

```
            DFS(j);
```

```

    }
    popped[k2++] = i;
}

int main()
{
    int i,j;
    printf("Enter number of vertices:");

    scanf("%d",&n);

    printf("\nEnter adjacency matrix of the graph:\n");

    for(i=0;i<n;i++)
    for(j=0;j<n;j++)
        scanf("%d",&G[i][j]);

    for(i=0;i<n;i++)
        visited[i]=0;

    DFS(0);
    printf("\nPush order: ");
    for(i=0;i<n;++i){
        printf("%d ",pushed[i]);
    }
    printf("\nPop order: ");
    for(i=0;i<n;++i){
        printf("%d ",popped[i]);
    }
    return 0;
}

```

Execution –

```
Enter adjacency matrix of the graph:
```

```
0 1 0 1 0 0 0 0 1
1 0 0 0 0 0 0 0 1 0
0 0 0 1 0 1 0 1 0
1 0 1 0 1 0 0 0 0 0
0 0 0 1 0 0 0 0 0 1
0 0 1 0 0 0 1 0 0 0
0 0 0 0 0 1 0 0 0 0
0 1 1 0 0 0 0 0 0 0
1 0 0 0 1 0 0 0 0 0
```

```
Visited 0
```

```

```

```
Visited 7
```

```
Visited 2
```

```
Visited 3
```

```
Visited 4
```

```
Visited 8
```

```
Visited 5
```

```
Visited 6
```

```
Push order: 0 1 7 2 3 4 8 5 6
```

```
Pop order: 8 4 3 6 5 2 7 1 0
```

Analysis –

We use stack for DFS. A graph with n vertices is considered here. Time spent for insertion and deletion of items from stack is $O(1)$ for each item. Since n vertices, therefore $O(n)$. To check adjacency, we can iterate over n vertices for n vertices therefore $O(|n|^2)$ order of growth. For adjacency list it's $O(|n| + |e|)$ where e is number of edges.

3). Write a program for breadth-first search of a graph.

Code –

```
#include <stdio.h>
```

```
#include <stdlib.h>
```

```
int g[100][100];
```

```
int n;
```

```
int visited[100];
```

```
int queue[100], f = 0, r = 0;
```

```
void enqueue(int v)
```

```
{
```

```
    if(f == -1)
```

```
        f = 0;
        queue[r++] = v;
    }
```

```
int dequeue()
{
    if(f == r)
    {
        return -1;
    }

    return queue[f++];
}
```

```
void bfs()
{
    int i, v;
    enqueue(0);
    do
    {
        v = dequeue();

        if(v != -1 && !visited[v])
        {
            printf("\nVisited %d", v);
            visited[v] = 1;

            int i;

            for(i = 0; i < n; ++i)
            {
```

```

        if(!visited[i] && g[v][i] && i != v)
        {
            enqueue(i);
        }
    }
}
}while (v != -1);
}

```

```

int main()
{
    printf("Enter the Number of Vertices: ");
    scanf(" %d", &n);

    int i, j;

    printf("Enter the Adjacency Matrix:\n");

    for (i = 0; i < n; ++i)
    {
        for (j = 0; j < n; ++j)
        {
            scanf(" %d", &g[i][j]);
        }
    }

    bfs();

    return 0;
}

```

```

Enter the Number of Vertices: 9
Enter the Adjacency Matrix:
0 1 0 1 0 0 0 0 1
1 0 0 0 0 0 0 1 0
0 0 0 1 0 1 0 1 0
